I was working on my own blog software tonight when I realized that pretty much everything i wanted to do with my software had already been done with Blog.cfc. With that in mind, I decided to move to Blog.cfc and see what it is all about.

Below is a **JavaScript** code test:

```
;( function ( $, window, document, undefined ) {
```

```
$fn.random = function () { return this.eq(Math.floor(Math.random()*this.length)); }
```

```
})( jQuery, window, document );
```

Below is a ColdFusion code test:

```
<!---
Create a buffer for our output of the way various Scopes are
presented during different HTTP requests.
--->
<cfsavecontent variable="debugOutput">

<cfdump
var="#cgi#"
label="CGI Scope"
show="content_type, request_method"
/>

<br />

<cfdump
var="#getHttpRequestData()#"
label="HTTP Request Data"
/>

<br />

<cfdump
var="Content: #toString( getHttpRequestData().content )#"
label="Content"
/>

<br />
<br />

<cfdump
var="#url#"
label="URL Scope"
/>
```

```
<br />

<cfdump
var="#form#"
label="Form Scope"
/>

</cfsavecontent>

<!--- Send HTML output back to the client. --->
<cfcontent
type="text/html; charset=utf-8"
variable="#toBinary( toBase64( debugOutput ) )#"
/>
```
